# User threat protection

How is this different from other cyber tools and processes ?

such as Penetration testing - **hacking** your site so no one else can ?

vulnerability scanning – automated scanning for vulnerabilities of OS, hardware, running applications and ports ?

application security – vulnerable code, packages and dependencies ?

intelligence – what is on the dark web ? user names, passwords, emails, addresses ?

user education - helping your users to know when something is suspicious ?

# User error

90% of breaches are caused by human error

internally we can educate our users not click on suspicious emails

but what about our external users ?

what about external users that don't know that they are going to the wrong site ?

# BCTChecker – User threat protection

BCTChecker pro-actively finds and identifies sites that look like yours *but are not* – it looks for spoof / fake / phishing sites

your team can find suspicious or phishing sites before your users do

stopping sites or warning your users early saves -

**your staff time working through complaints and user issues**

**you money in fewer refunds and associated costs**

**embarrassment by your customers in getting tricked**

**your brand and keeps your name out of the news for all the wrong reasons**

# BCTChecker – Brand protection

as well as protecting your brand and keeping your name out of the news

BCTChecker helps your team ensure that your brand's domains are owned by you. You own *yourdomain.com* ? Great. What about *yourdomain.com.nz* or *yourdomain.com.hk* ? or *yourdomain.co* ?

protecting your domains also helps protect and prevent both domain hijacking by hackers but also helps prevent your domain becoming a hostage of cybersquatting

do you really want to have to buy your domain back off someone else or wait for them to let it go ?  
Especially if you could have bought it first ?
